The political economy of digital profiteering: communication resource mobilization by anti-vaccination actors

Aliaksandr Herasimenka^{ID} ^{1*}, Yung Au¹, Anna George¹, Kate Joynes-Burgess¹, Aleksi Knuutila¹, Jonathan Bright^{ID} ^{1,2}, Philip N. Howard¹

Abstract

Contemporary communication requires both a supply of content and a digital information infrastructure. Modern campaigns of misinformation are especially dependent on that back-end infrastructure for tracking and targeting a sympathetic audience and generating revenue that can sustain the campaign financially—if not enable profiteering. However, little is known about the political economy of misinformation, particularly those campaigns spreading misleading or harmful content about public health guidelines and vaccination programs. To understand the political economy of health misinformation, we analyze the content and infrastructure networks of 59 groups involved in communicating misinformation about vaccination programs. With a unique collection of tracker and communication infrastructure data, we demonstrate how the political economy of misinformation depends on platform monetization infrastructures. We offer a theory of communication resource mobilization that advances understanding of the communicative context, organizational interactions, and political outcomes of misinformation production.

Keywords: hybrid media, vaccines, COVID-19, misinformation, communication resource mobilization

Misinformation and professional news on largely unmoderated platforms: the case of telegram

Aliaksandr Herasimenka , Jonathan Bright , Aleksi Knuutila, and Philip N. Howard 

Oxford Internet Institute, University of Oxford, Oxford, United Kingdom

ABSTRACT

To date, there is little research to measure the scale of misinformation and understand how it spreads on largely unmoderated platforms. Our analysis of 200,000 Telegram posts demonstrates that links to known sources of misleading information are shared more often than links to professional news content, but the former stays confined to relatively few channels. We conclude that, contrary to popular received wisdom, the audience for misinformation is not a general one, but a small and active community of users. Our study strengthens an empirical consensus regarding the spread of misinformation and expands it for the case of Telegram.

KEYWORDS

Misinformation; news consumption; Telegram; digital platforms; platform governance; news; content moderation

Introduction

The quality of news and information that individuals encounter online remains a source of critical contemporary concern. It is by now well documented

efforts to regulate and moderate users' content. Moderation of user content such as posts and comments, whether on the websites of news organizations or on social media platforms, has become one

Research Article

Who is afraid of fake news? Modeling risk perceptions of misinformation in 142 countries

Using survey data from 154,195 respondents in 142 countries, we investigate internet user perceptions of the risks associated with being exposed to misinformation. We find that: 1) The majority of regular internet users globally (58.5%) worry about misinformation, and young and low-income groups are most likely to be concerned. 2) Risk perception among internet users varies starkly across regions whereby concern is highest in Latin America and the Caribbean (74.2%), and lowest in South Asia (31.2%). 3) Differences are unrelated to the prevalence of misinformation, yet concern is highest in countries with liberal democratic governments. We discuss implications for successful policy and platform interventions.

Globally Perceived Risk

154,195 participants living in 142 countries

1

Disinformation is the single most important fear of internet and social media use. More than half (53%) of regular internet users are concerned about disinformation.

2

Almost three quarters (71%) of internet users are worried about a mixture of threats, including online disinformation, fraud and harassment.

3

Concerns about disinformation vary by region—highest in North America and Europe, and lowest in East and South Asia. Concern about online harassment is higher among women, especially in Latin America.

Expert Consensus

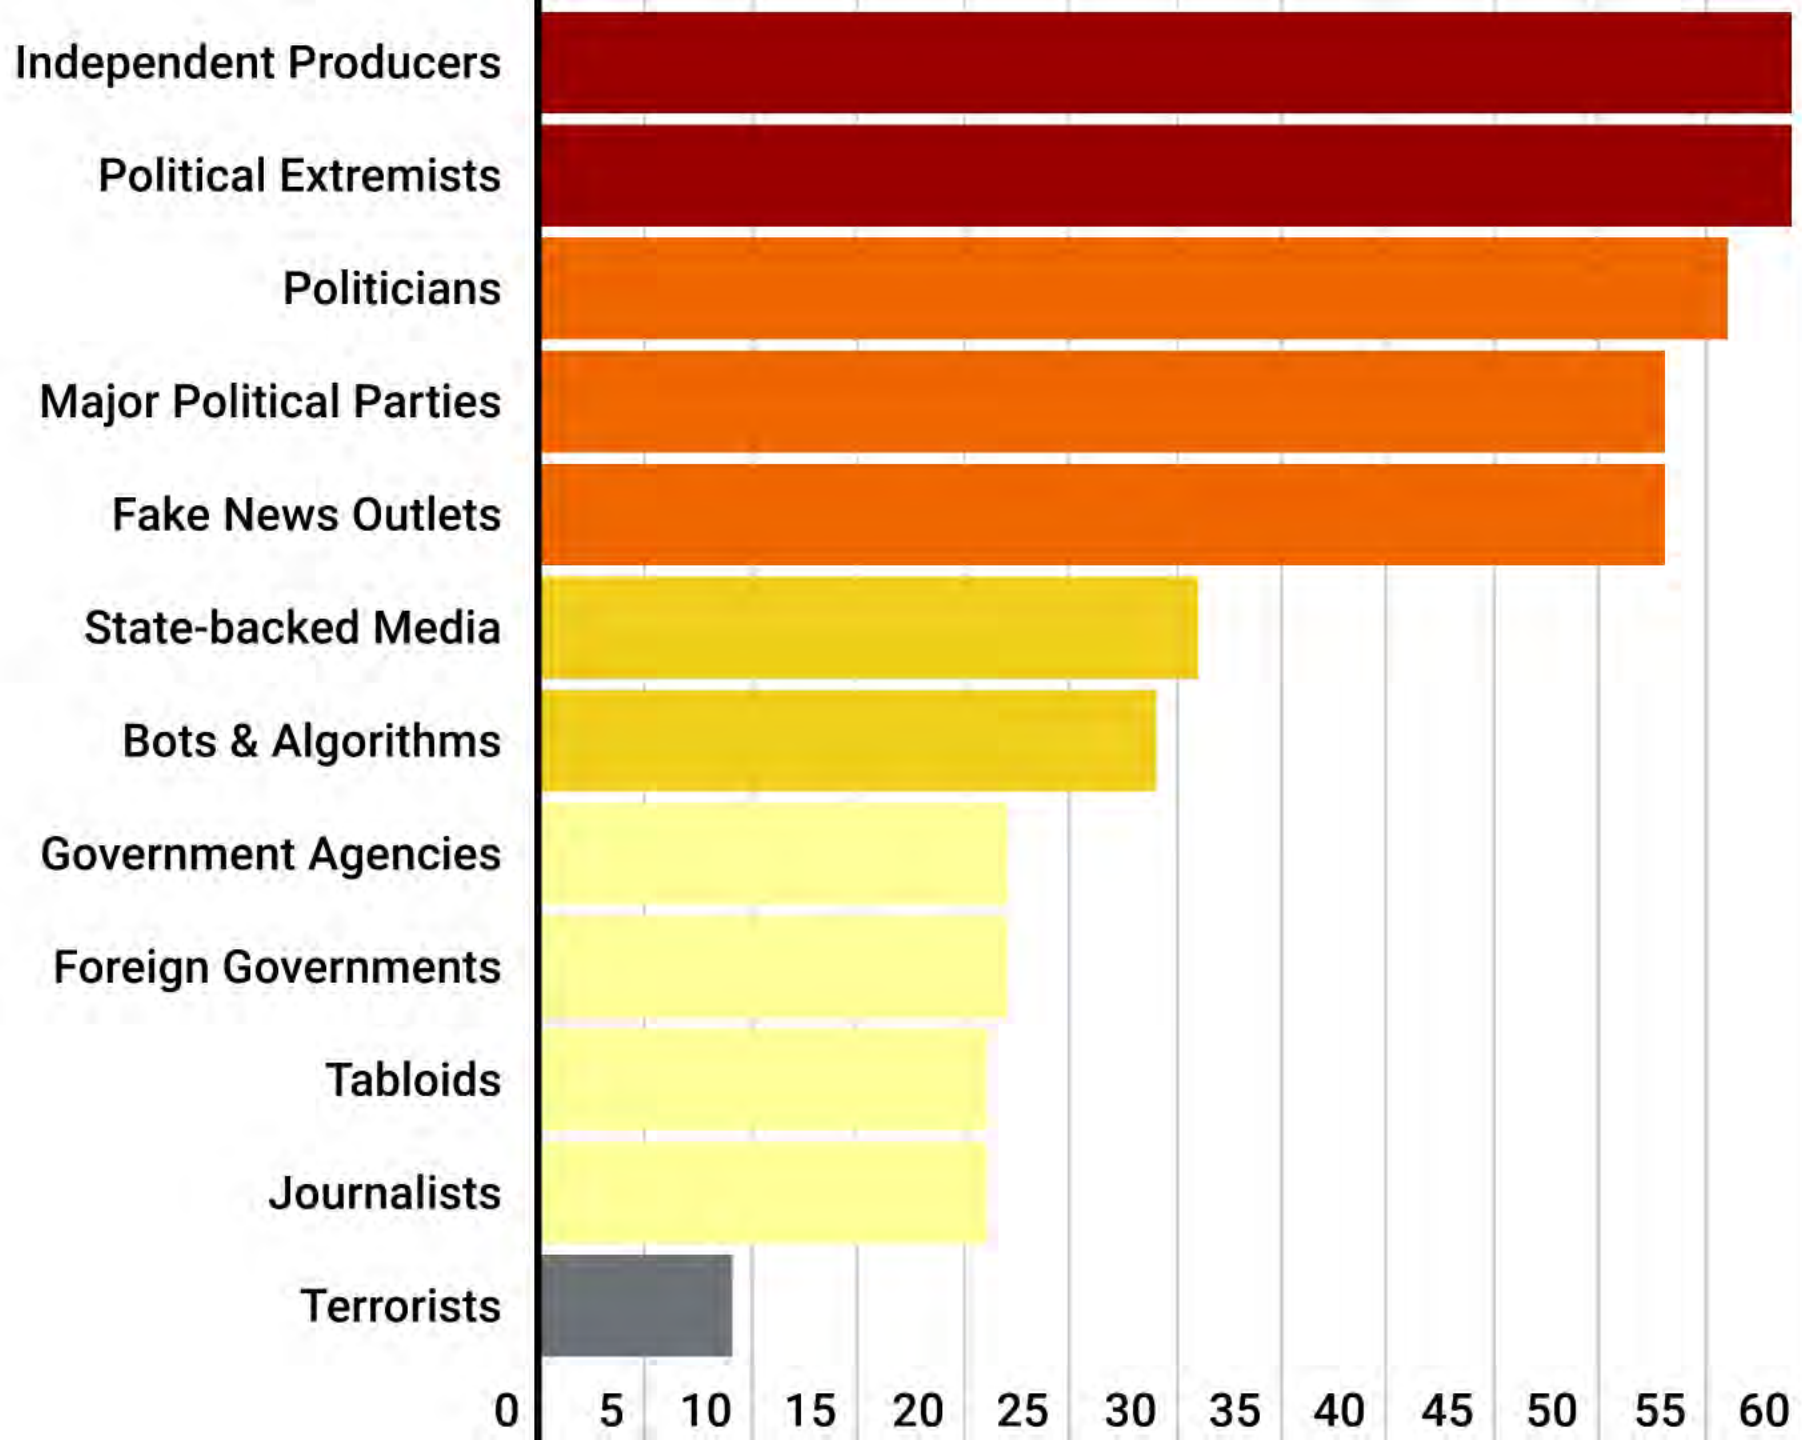

Sources

- Technology companies are not doing enough to curb the spread of misinformation on their platforms, and Facebook, Twitter, and YouTube are the most problematic.
- Globally, experts agree that local politics, Covid-19, and regional immigration crises are the most common topics of misinformation.
- Foreign information operations are the biggest threat to the public life in the Global North, while local governments are the worst source of misinformation in the Global South.
